Additional Problems

1. Suppose \( f \) is a continuous function such that

\]
for all \( x \). Find an explicit formula for \( f(x) \) and sketch a graph of \( y = f(x) \).

   (b) Find the absolute maximum value and the absolute minimum value of \( y = F(x) \) (if they exist).
   (c) Sketch a graph of \( y = f(x) \).

3. Consider the function \( F \) defined by \( F(x) = \int_{1}^{x} (\sin t + \ln t) \, dt \) for \( x > 0 \).

2. The rate at which people enter an amusement park on a given day is modeled by the function \( E \) defined by

\[
E(t) = \frac{15600}{(t^2 - 24t + 160)}.
\]

The rate at which people leave the same amusement park on the same day is modeled by the function \( L \) defined by

\[
L(t) = \frac{9890}{(t^2 - 38t + 370)}.
\]

Both \( E(t) \) and \( L(t) \) are measured in people per hour and time \( t \) is measured in hours after midnight. These functions are valid for \( 9 \leq t \leq 23 \), the hours during which the park is open. At time \( t = 9 \), there are no people in the park.

(a) How many people have entered the park by 5:00 P.M. \((t = 17)\)? Round your answer to the nearest whole number.

(b) The price of admission to the park is $15 until 5:00 P.M. \((t = 17)\). After 5:00 P.M., the price of admission to the park is $11. How many dollars are collected from admissions to the park on the given day? Round your answer to the nearest whole number.

(c) Let \( H(t) = \int_9^t (E(x) - L(x)) \, dx \) for \( 9 \leq t \leq 23 \). The value of \( H(17) \) to the nearest whole number is 3725. Find the value of \( H'(17) \), and explain the meaning of \( H(17) \) and \( H'(17) \) in the context of the amusement park.

(d) At what time \( t \), for \( 9 \leq t \leq 23 \), does the model predict that the number of people in the park is a maximum?

\[
\begin{align*}
\text{(a) } & \int_9^{17} E(t) \, dt = 6004 \text{ people} \\
\text{(b) } & 15 \int_9^{17} E(t) \, dt + 11 \int_9^{23} E(t) \, dt \\
& \approx 1104.048 \\
\text{(c) } & H'(t) = E(t) - L(t) \\
& H'(17) = E(17) - L(17) = -380.281 \\
& H(17) = 3725 \text{ means there were } 3725 \text{ in the park at } t=17 \text{ (5:00 PM)} \\
& \text{and } H'(17) = -380.281 \text{ means the} \\
& \text{rate of people in the park was decreasing at a rate of 380 people/hr}.
\end{align*}
